VM ADVISORY
securing your cyberspace

Why do you need to protect your organization's personal and sensitive data?

The companies must be ready to avoid the reputational damage caused by a data leak and its negative effects on the confidence of employees as well as the current and potential customers.

Organisations are facing various challenges to comply with the SA POPI and upcoming EU GDPR regulations. Mainly, they need to be able to reduce the proliferation of uncontrolled and unstructured data.

Unstructured data held on servers as well as on employees' and collaborators' (partners, consultants, etc.) endpoints and devices make up roughly 80 percent of all business related data. As the volume of unstructured data doubles every year, so does the risk posed to businesses.

Fight off the exponential increase in exfiltration cases.

The number of cases where poorly managed and secured data is exfiltrated from computing systems is increasing every day. Often the affected organisation is not even aware that this is happening. These data thefts are usually due to external attacks, malicious insiders driven by lucrative objectives or revenge, or simply negligence.

Solution

Our recommended solution is **Data Control**, which is an optional data security module that can be fully integrated into the next-gen Endpoint Protection platform - Adaptive Defense 360. **Data Control** is designed to assist organisations in complying with data protection regulations, as well as discovering and protecting personal and sensitive data both in real time and throughout its lifecycle on endpoints and servers.

Data Control discovers, audits and monitors **unstructured personal data** on endpoints: from data at rest to data in use and data in motion.

Key benefits

- **Discover and audit**: Identify files with Personally Identifiable Information (PII) including the users, employees, collaborators, endpoints and servers in your organization that are accessing any personal data.

- **Monitor and detect**: Implement proactive measures to prevent access to PII with the help of reports and real-time alerts on the unauthorized and suspicious use, transmission and exfiltration of personal data files.

- **Simplify management**: The **Data Control module** doesn't require organizations to deploy any additional software or hardware and can be easily and immediately activated without cumbersome configurations as a part of the Adaptive Defense 360 platform. **The Data Control module** is enabled and managed entirely from the cloud.

- **EU GDPR compliance**: It is achieved by discovering, monitoring and controlling of unstructured personal data on all your endpoints
